

Plantcare chemicals supplied by CBI as from August 2026

Since some Cycad species are extremely rare and valuable, successful sucker/cutting removal and settlement is vital. Our scientifically well-developed methods prove to be very successful, and we experience and expect success of better than 90%.

We include the detailed **CBI Plant Treatment Instructions** with the shipment, and also read the **First Aid Treatment Guide** inside. For more information and best results, please see the CBI videos on media, for taking off suckers, treating the mother plant, the suckers/cuttings in the luxury bath, and to seal the Suckers/cuttings before planting. Shake liquid chemical bottles regularly for consistency. Do not hesitate to contact us for assistance.

The standard chemicals supplied by the CBI, are used for :

- treating mother plant wounds when suckers/cuttings are taken off from the mother plant.
- dunking the suckers/cuttings into our "Luxury Bath" which contains growth hormones, nourishment and both bacterial and fungal protection.
- applying root hormones to stimulate root formation from sucker/cutting wounds.
- sealing the sucker/cutting wounds before planting.

We supply small quantities for the small garden applications and to experiment with the success, and larger quantities for large gardens and nurseries. The customer is welcome to mix bin sizes as the need demand. All the chemicals we supply are stable and safe, and has a long storage life. Note that once the chemicals are mixed with water, it can be used over four weeks as the active ingredients do not break down as fast as systemic fungicide we recommended before. We also move away from systemic fungicide due to their highly toxic and cancer forming properties, and they do not protect your plant against bacterial infection.
